

Questions, and where the data comes from

Francisco Villamil

Research Design for Social Sciences
MA Computational Social Science, UC3M
Fall 2026

Assignment

1. Questions?
2. On quick reading: standard, apply-to-all critiques
3. Working in pairs or individually: 10% incentive

Where we are

1. Why design at all?
2. **What is the question, and where would the data come from?**
3. Do the numbers mean what you think they mean?
4. What comparisons can we use to establish causal claims?
5. What variation can you exploit, and how far does the answer travel?

Roadmap

From topic to research question

Theory, mechanisms, levels

Where does the data come from?

Ten things about big data sources

So where do you actually get data?

Paper: The Parable of Google Flu

Before next week

Research and RQs

- Research = answering questions
- Re-cap on research types:
 1. **Normative** vs. **positive** research
 2. Positive: **theoretical** vs. **empirical**
 3. Empirical: **describe**, **explain**, **predict**

Example on types of questions and evidence

- You are doing the analytics behind a campaign for Mahou
- Think of questions that are:
 - Descriptive
 - Explanatory
 - Predictive
- Which ones could you answer with the data a brewer actually has?

What is a research question?

- Any question we can answer
- Sometimes we say that we derive an RQ from a topic, and a theory from an RQ
 - **Topic > RQ > Theory**
- In reality, an RQ can be thought of as an operationalization of an argument
 - **Previous evidence > Argument > RQ > Hypotheses**
- **Even though** this 'argument' can be something anecdotal that we later develop into a proper, abstract theoretical argument
 - And it would actually look into something like this:
 - Previous > 'Anecdotal argument' > RQ > (Proper) Theory > Hs

What is a research question? Example

- Topic/idea: Charlie Kirk and the rise of political violence?
- 'Anecdotal argument'/intuition: online radicalization and young men more likely to commit individual acts of violence
- 'Main' RQ: Does online media cause an increase in lone-wolf political violence?
 - RQ1: Has political violence increased recently?
 - RQ2: Political violence now more likely by individual young men?
 - RQ3: Is online radicalization the cause of this?
- Theoretical argument, hypotheses, expectations, etc

Good RQs, in brief

1. Empirically **answerable**

→ i.e. you can answer it with data

2. Theoretically **relevant**

→ i.e. it helps you learn something about your theory/argument

Good RQs, more in detail

1. Consider potential results of the analyses

- if you found X, does that answer the question? causally?
- example: are kids who play videogames often more aggressive?
- does that inform a theory on the aggressiveness effect of VGs?
(you can even try to do a better RQ without causal ID)

2. Is it feasible?

- do you have the data? is it possible to do it? (e.g. algorithm to predict re-offenders, biased by arrests)
- also: is there any design or strategy to answer it?

3. Keeping it simple and narrow

- what are the causes of economic underdevelopment? vs. does exposure to natural disasters hinders economic development?

Good RQs, more in detail

This:

- Has political violence increased recently?
- Political violence now more likely by individual young men?
- Is online radicalization the cause of this?

vs this:

- What's the link between online media and political violence?
(too broad)
- Is online media the cause of the increase of political violence among young men? (many questions in one)
- Why does online media drive political violence? (??)

Example on generating RQs

- Couple things to remember:
 - RQs are often the link between theory and empirics
 - So they already suggest which variation to look at
- Imagine you have the following argument:

How good students do at school depends more on the peers they are surrounded by than on the quality of the teaching they receive
- Which RQ could let us test this?

Stories, RQs, and theories

- There're no exclusive definitions of 'stories' and theories
- It's just about getting to a sufficient level of abstraction
- Often, you start with a story or example, and then you move up the ladder for both theory and RQs until you get to a general theory tested with a RQ

Generating theories

- No recipe for this, everyone generates theories *all the time*
- Usually it refers to an analytical argument that explains something
 - It could also be a descriptive or predictive theory, but even in those cases there's probably an explanation underneath
- Developed inductively, from descriptive data to general explanations
- My advice: if you can't tell a story out of the theory, you're not there yet (i.e. need to be able to travel from/to abstraction)
- **Q:** How to identify a **good theory**?

Evaluating theories

1. Simple
2. Internally coherent and able to explain variation
3. Testable

Example (of the whole process)

Internacionales UMU
@internacionalUMU

¿Y sabías que encuentran **#trabajo** más rápido que los estudiantes que no realizan **#movilidad**?

3 de cada 4 graduados Erasmus+ consideran que su **#experiencia** en el extranjero es beneficiosa para encontrar su primer trabajo, y el 80% encontraron trabajo 3 meses después de graduarse.

Translate Tweet

The advertisement graphic features a blue background with a hand pointing at a glowing orange figure icon. To the right, there are smaller icons of people in circles. The text is in white and yellow.

Erasmus+ ESTUDIOS

DIFERENCIATE DEL RESTO

Los estudiantes Erasmus+ encuentran trabajo más rápido que los estudiantes que no realizan movilidad.

ELIGE TU DESTINO
ELIGE ERASMUS

Solicitud abierta hasta el 14/12/20
erasmus.um.es

UNIVERSIDAD DE MURCIA

12:05 PM · Nov 23, 2020 · Twitter Web App

Example

- That's some descriptive evidence that could inspire an anecdote
- The **anecdotal argument** (think of a story)
 - My friend John who went on Erasmus has more money than my other friend who couldn't go, and also, John managed to get a job because his father is partner at a local firm
- The **research question**
 - Is there a causal effect of Erasmus on labor market early success? Is the effect mediated by household income?
- The 'proper' **theory**
 - Going on Erasmus does not have any causal effect on getting a first job, the relationship is explained by the confounding effect of income
 - Or: Positive effect among high-income students because they have access to informal networks where this experience is valued
- The **hypotheses?**

Hypotheses

- Hypothesis is just a very formal term for empirical expectations
 - Which essentially means being able to say what you expect to see given a theory
And ideally, knowing what you need to see in order to discredit the theory
- Imagine that I have the theory that my knee hurts when I do sports on cold days
 - Simplifying it, we have a 2x2 situation:

Hypotheses: what would you expect to observe?

	<i>Cold day</i>	<i>Hot day</i>
<i>Run</i>	Pain	Not pain
<i>Didn't run</i>	Not pain	Not pain

What if you observe this? **New theory? Test?**

	<i>Cold day</i>	<i>Hot day</i>
<i>Run</i>	Pain	Not pain
<i>Didn't run</i>	Pain	Pain

Roadmap

From topic to research question

Theory, mechanisms, levels

Where does the data come from?

Ten things about big data sources

So where do you actually get data?

Paper: The Parable of Google Flu

Before next week

Computational methods and theory

- Limitations of *data mining*
- Focus on the what rather than on the why
- Problems with machine learning
 - Example of predicting ice cream sales

Why bother about theory?

CIVIL UNREST

Predicting Civil Conflict: What Machine Learning Can Tell Us

Computer programs can be used as early warning systems, allowing the global community to act before violence erupts.

Mechanisms briefly

- A **mechanism** is basically the **how** (or why) of a relationship
- e.g., we know that the flu gives us fever
 - flu > fever
- What's the mechanism?
 - flu > *immune system detects infection* > Δ *body temp* > fever
- Good thing about mechanisms is that we can try to test them

Testing mechanisms ($\approx$ sub-research questions)

- Let's go back to the Erasmus example
- If our theory is that the effect of going on Erasmus is higher for high-income students due to their access to social networks,
what's the mechanism?
- And how could we try to **test it**?
 - (Think about the sub-RQs)

Complexity of the social world and micro/macro

- Why do mass protests emerge?

Levels of explanation

Can you think of...?

- Macro-level mechanisms
- Micro-level mechanisms

- What's the point of macro-level explanations, actually?

Recap

- Questions on theory, RQ, or mechanisms?

Roadmap

Theory, mechanisms, levels

Where does the data come from?

Ten things about big data sources

So where do you actually get data?

Paper: The Parable of Google Flu

Before next week

Types of data, briefly

Designed

answers a question **you** (or other *researchers*) had

Found

answers no question at all, or just other types of logic (non-scientific)

Today: what follows from being on the right-hand side.

Readymade

Custommade

Figure 1.2: *Fountain* by Marcel Duchamp and *David* by Michelangelo. *Fountain* is an example of a readymade, where an artist sees something that already exists in the world and then creatively repurposes it for art. *David* is an example of art that was intentionally created; it is a custommade. Social research in the digital age will involve both readymades and custommades. Photograph of *Fountain* by Alfred Stieglitz, 1917 (Source: *The Blind Man*, no.

Designed data: someone decided what to record

A survey, and a hand-coded conflict dataset. Someone wrote the questions, or the coding rules.

Found data: nobody decided anything, for you

Abstract

Zipf-like distributions characterize a wide set of phenomena in physics, biology, economics, and social sciences. In human activities, Zipf's law describes, for example, the frequency of appearance of words in a text or the purchase types in shopping patterns. In the latter, the uneven distribution of transaction types is bound with the temporal sequences of purchases of individual choices. In this work, we define a framework using a text compression technique

RESEARCH ARTICLE

Faces in the crowd: Twitter as alternative to protest surveys

Abstract

Who goes to protests? To answer this question, existing research has relied either on retrospective surveys of populations or in-protest surveys of participants. Both techniques are prohibitively costly and face logistical and methodological constraints. In this article, we investigate the possibility of surveying protests using Twitter. We propose two techniques for sampling protestors on the ground from digital traces and estimate the demographic and ideological composition of ten protestor crowds using multidimensional scaling and machine-learning techniques. We test the accuracy of our estimates by comparing to two in-protest surveys from the 2017 Women's March in Washington, D.C. Results show that our Twitter sampling techniques are superior to hashtag sampling alone. They also approximate the ideology and gender distributions derived from on-the-ground surveys, albeit with some bias, but fail to retrieve accurate age group estimates. We conclude that online samples are yet unable to provide reliable representative samples of offline protest.

Credit card transactions and social media posts, repurposed as research data.

The asymmetry that matters

- With **designed** data, you know what the numbers were meant to mean, because someone wrote it down (*even though...*)
- With **found** data, you have to **reconstruct** it, from the purpose of whoever built the system
- So: who made this, and what were they trying to do?

Roadmap

From topic to research question

Theory, mechanisms, levels

Where does the data come from?

Ten things about big data sources

So where do you actually get data?

Paper: The Parable of Google Flu

Before next week

Salganik's ten characteristics

Why we want them

Big

Always-on

Non-reactive

Why designs break

Incomplete

Inaccessible

Non-representative

Drifting

Algorithmically confounded

Dirty

Sensitive

Salganik, *Bit by Bit*

Big, always-on, non-reactive

- **Big:** rare events become studiable, and small differences become visible
 - but big does not fix bias. It makes you *confident* about the wrong number
- **Always-on:** you can study things that were not anticipated, and study them *before and after*
 - unexpected events get a baseline for free
- **Non-reactive:** people are not answering your questions, so they are not performing for you
 - no social desirability bias. But no informed consent either

Non-representative

- Who is on the platform is not who is in the population
- Who *posts* is not who is on the platform
- So: is a non-representative sample useless?

The Xbox poll

- 2012 US election. Opt-in poll served to **Xbox** users
- ~350,000 respondents. Around 93% male, overwhelmingly young
- Raw numbers: a large Romney lead. Wrong, and obviously so
- Adjusted using what was *known* about who was missing: tracked the campaign closely and called the outcome

Wang, Rothschild, Goel & Gelman (2015), *Int. J. Forecasting* 31(3).

Drifting

- The world changes
- The people on the platform change
- **The platform changes**

A measure can stop meaning what it meant,
without anything looking wrong .

Google Flu Trends

- 2008: predict flu prevalence from search queries. Faster than the CDC, and it worked
- 2009: missed the H1N1 pandemic, a flu outbreak that was not seasonal
- 2011–13: over-predicted almost every week. In the 2012–13 season, more than **double** the CDC figure

What went wrong?

- **Big data hubris:** the assumption that volume substitutes for measurement
 - it was fitted to correlate with CDC data, not to measure flu
- **Algorithm dynamics:** Google kept changing the search engine
 - suggested searches, autocomplete, health panels
 - people searched differently because the *product* changed

The instrument was being modified,
by someone who was not doing research .

Algorithmically confounded

- Platforms do not just record behaviour. They **shape** it
 - ranking, recommendation, defaults, what is easy and what is hidden
- So an observed pattern may be a property of **the system**, not of the people
- The platform is in your causal diagram (week 4)

Inaccessible, and the post-API age

- The data belongs to someone, and they can revoke access
 - Twitter/X academic access, closed 2023
 - CrowdTangle, shut down 2024
- A design that depends on access you do not control is a design that can **stop working**
- And nobody can check your results afterwards

Freelon (2018), Computational Research in the Post-API Age, *Political Communication* 35(4).

Dirty, and sensitive

- **Dirty:** spam, bots, duplicates, tests, automated accounts
 - the cleaning decisions are design decisions, and they are rarely reported
- **Sensitive:** much of it is about identifiable people who never agreed to anything
 - “it’s public” is not the same as “they consented”
 - aggregation and linkage can re-identify

(week 5)

Incomplete

- The variable you need is almost never the variable that was recorded
 - platforms record what is useful to them, not what is useful to you
- No demographics. No income. No control variables
- You can sometimes **infer** what is missing. That is a model, and models can be wrong

Roadmap

From topic to research question

Theory, mechanisms, levels

Where does the data come from?

Ten things about big data sources

So where do you actually get data?

Paper: The Parable of Google Flu

Before next week

A practical interlude

You have a question. Now what?

- Most projects in this programme use data somebody has already published
- Knowing what exists, and what it looks like when it arrives, is a real skill

Places things actually live

2 V-Dem Democracy Indices

2.1 V-Dem High-Level Democracy Indices

This section groups together macro-level indices that describe features of democracy at the highest (most abstract) level. Please see Appendix A for an overview of all indices, component-indices, and lower-level indices.

2.1.1 Electoral democracy index (D) (v2x_polyarchy)

Project Manager(s): Jan Teorell

Additional versions: *_codelow, *_codehigh, *_sd

Question: To what extent is the ideal of electoral democracy in its fullest sense achieved?

Clarification: The electoral principle of democracy seeks to embody the core value of making rulers responsive to citizens, achieved through electoral competition for the electorate's approval under circumstances when suffrage is extensive; political and civil society organizations can operate freely; elections are clean and not marred by fraud or systematic irregularities; and elections affect the composition of the chief executive of the country. In between elections, there is freedom of expression and an independent media capable of presenting alternative views on matters of political relevance. In the V-Dem conceptual scheme, electoral democracy is understood as an essential element of any other conception of representative democracy — liberal, participatory, deliberative, egalitarian, or some other.

Scale: Interval, from low to high (0-1).

Source(s): v2x_freexp_altinf v2x_frassoc_thick v2x_suffr v2xel_frefair v2x_elecoff

Data release: 1-15. Release 1-5 used a different, preliminary aggregation formula.

Aggregation: The index is formed by taking the average of, on the one hand, the weighted average of the indices measuring freedom of association thick (v2x_frassoc_thick), clean elections (v2xel_frefair), freedom of expression (v2x_freexp_altinf), elected officials (v2x_elecoff), and suffrage (v2x_suffr) and, on the other, the five-way multiplicative interaction between those indices. This is half way between a straight average and strict multiplication, meaning the

Before you commit to a data source

- Who made it, and **why**?
- What is the **unit**, and what is the coverage in space and time?
- Is there a **codebook**? If not, what replaces it?
- Who or what is **missing**?
- Can you actually **get it**, and could someone else get it again?
- Has it **changed** over the period you care about?

Six questions. They are also, more or less, Memo 2.

Roadmap

From topic to research question

Theory, mechanisms, levels

Where does the data come from?

Ten things about big data sources

So where do you actually get data?

Paper: The Parable of Google Flu

Before next week

In pairs/groups

1. What was Google Flu Trends actually **measuring**?
2. Whose behaviour changed: the public's, or Google's?
3. Would **more data** have fixed it?
4. What would you have had to do in 2009 to see this coming?

Groups of four: redesign it

You have Google's search logs and CDC data, in 2009.
Build something that does not break the same way.

Next week

Part of the problem of GFT was the fact that the numbers didn't really mean what they intended them to mean.
That's a measurement problem.

Roadmap

From topic to research question
